

Frequently Asked Questions

Should I perform this test if I have had a positive COVID-19 PCR result in the last 3 months?

No. You should not do the LFD test if you have had a positive Covid-19 PCR in the last 90 days. The LFD may give a false positive result if you have recently had Covid-19.

If however you tested PCR positive for COVID-19 more than 90 days ago, then you are encouraged to be involved in the testing, since re-infection after 3 months has been described, although sporadically.

When should I NOT perform the LFD test?

- *You should not perform the test on non-work days, when on leave or if working from home.*
- *If you have had a positive Covid-19 PCR in the previous 90 days, you should not perform the LFD as it may give false positive result.*
- ***You should not use testing kits on anyone else including friends and family.***
- ***If you have any Covid-19 symptoms, you should NOT perform the LFD test.***
